I. Codebase

What is a codebase, source code repository, and a version control system?

- In software development, a **codebase** refers to a whole collection of source code that is used to build a particular software system, application, or software component.

- A codebase includes only **human-written source code files**; thus, a codebase usually does not include source code files generated by tools (generated files) or binary library files (object files).

- It generally does include **configuration and property files**, as they are the data necessary for the build.
